To:

STIC-Biotech/ChemLib

Subject:

Sequence search of Application No.10/618570

Please do a standard search on:

SEQ ID NOS: 1 and 2 against nucleic acid databases (excluding pending databases).

Thank you very much!

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                      US-10-618-570-2

supplier: RNA was isolated from Nicotiana benthamiana
tissues that include callus, roots from liquid culture
grown plants, heat-stressed leaves (3s C, 3 hr and 6 hr),
cold-stressed leaves (5 C 3 hr, 6hr), and pathogen
challenged leaves (Feeudomonas syringae pv comato 12 hr;
Xanthomonas campestris pv campestris 12 hr, 18hr;
Pseudomonas syringae pv campestris 12 hr, and Xanthomonas
campestris pv vesicaticia l8hr). RNA was isolated from
these tissues and pooled in approximately equal molar
                                                                                                     Enkaryotta; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta; Spermatophyta; Magnoliophyta; eudicotyledons; core eudicotyledons; spermatophyta; Magnoliophyta; eudicotyledons; core eudicotyledons; steratophyta; Magnoliophyta; eudicotyledons; core eudicotyledons; steratophyta; Magnoliophyta; eudicotyledons; core eudicotyledons; steratophyta; Magnoliophyta; Solanaceae; Nicotiana.

supplier: RNA was isolated from Nicotiana benthamiana
tissues that include callus, roots from liquid culture
grown plants, heat-estressed leaves (38 C, 3 hr and 6 hr),
cold-stressed leaves (5 3 hr, 6hr), and pathogen
challenged leaves (Pseudomonas syringae py tomato 12 hr;
Xanthomonas campestris py campestris 12 hr, 18hr;
Pseudomonas syringae py phaseolicola 18hr, and Xanthomonas
campestris py vesicatoria 18hr). RNA was isolated from
these tissues and pooled in approximately equal molar
                          CK291799 933 bp mRNA linear EST 02-AUG-2004 EST754513 Nicotiana benthamiana mixed tissue cDNA library, normalized, full-length Nicotiana benthamiana cDNA clone NBMC477 5'

Sequence tag generated by 3'RACE corresponds to a gene disrupted in mouse BS cells that may be transmitted into the mouse germilne. The inserted entrapment vector can be engineered by Cre-mediated cassette exchange. The 3' end of a split puromycin resistance gene carried by the vector may also be used to select for Cre-mediated chromosome deletion and recombination events. ES cells containing the insertion mutation are available on request.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /gex="male" / form=" / form |

/tissue_type="abiotic and biotic stress-treated leaves, callus tissue and root tissue"
/lab host="bhi08-TonA"
/lab host="Dhi08-TonA"
/clone_lib="Nicotiana benthamiana mixed tissue cDNA
library, normalized, full-length"
/note="Vector: pCMVSport6.1; Site 1: BcoRI; Site 2: NotI;
supplier: RNA was isolated from Nicotiana benthamiana
tissues that include callus, roots from liquid culture
grown plants, heat-stressed leaves (5 C 3 hr, 6hr), and pathogen
cold-stressed leaves (Feeudomonas syringae pv tomato 12 hr;
Xanthomonas campestris pv campeetris 12 hr, 18hr;
Pseudomonas syringae pv phaseolicola 18hr, and Xanthomonas
campestris pv vesicatoria 18hr). RNA was isolated from
these tissues and pooled in approximately equal molar
amounts."

                                                                                      음
                                                                                                                                                                                                                              ö
                          This invention describes a novel protein (A) which comprises a membrane-spanning domain and an extracellular domain (BCD), where the ECD comprises biotin-binding activity. Using the proteins or encoding nucleic acid molecules it is possible to target biotinylated molecules to specific sites in tissues. Molecules targeted in this way may be taken up by the tissues or cells by endocytosis, allowing the molecules to exert their effects within or on the cell. This sequence encodes a bovine scavenger receptor class Alavidin fusion protein which is used in the description of the invention

This is the nucleotide sequence of pLANN, a plasmid designed to carry the chicken amylase gene (as a marker protein) and various control sequences chicken amylase gene (as a marker protein) and various control sequences for use in retroviral particle delivery to bovine mammary epithelial cells. The plasmid has the amylase gene and a selectable marker neo gene both under control of the long terminal repeat promoter of the Moloney murine leukamid virus. An internal ribosomal entry site (IRES) provides a translation initiation site within the transcript, allowing the downstream gene product to be produced. A method for producing a transcript sommanal for producing an altered composition of milk computes (1) providing a vector containing a DNA sequence encoding a valuable compound; (2) packaging the vector into a cell line to produce a transcript compound; (2) packaging the vector into a cell line to produce a transcript infecting particle; and (4) delivering the solution into the mammary gland to allow incorporation of the DNA into the accretory cells of the mammary gland. The new method is useful for producing milk with valuable compound and for a changed composition, to enhance its properties and/or marketability. The valuable compound is selected from: an antibody, an extent suppressor prociein, a vormone, a milk protein, a hormone receptor, a tumour suppressor protein, a vaccine, erythropoietin (claimed), a protein content suppressor protein, a promone, a milk protein, a hormone receptor of especially is a tissue plasminogen activator which may be extracted or the milk consumed directly as a therapeutic agent. The new method of concentration and yield of the foreign protein particle. The mammary epithelial cells than prior art methods, resulting in the concentration and yield of the foreign protein particle. The milk consument of more genes can be trans-infected. (Updated on 17-OCT-2003 to consume the concentration and yield of the fersas-infected on 17-OCT-2003 to consume the content of the milk of the foreig

The invention relates to a novel method for enhancing the survival of neutrons and/or of cells expressing tyrosine hydroxylase [EC 114.16.2 -
Tyrosine 3-monoxygenase] (TH +) I he method comprises contacting a population of cells with Bol-TW or its functional equivalent, where the population of cells with Bol-TW or its functional equivalent, where the population of cells is selected from: neutrons or cells capable of differentiating into neurons; or TH expressing cells or cells capable of differentiating into TH expressing cells. The invention further composition of isolated mammalian cells overexpressing the anti-apoptotic neutron; an implantable cell culture device comprising; a semi-permeable cell culture device comprising a semi-permeable cell culture device comprising the survival of TH + cells in vivo; a retroviral particle being produced based on a lentiviral transfer vector; enhancing the survival of Th voo differentiated dopamines on a retroviral transfer vector; enhancing the survival of the vool of the survival of the vool of the capable of producing an infective vector particle; treatment of a neurological disorder; a fusion protein comprising the expression vector; and producing comprising the expression vector; and producing comprising the expression vector; and producing membrane capable of directing the expression vector; and producing compression signal, an expression of the fusion protein in a membrane confine for the fusion protein and a promoter of the fusion protein in a medicament useful for the treatment of a medicament useful for the preparation of a medicament commence o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 hydroxylase for the treatment of neurodegenerative disorders.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            354
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  414
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          594
                introduction of a therapeutic gene comprising: (1) a nucleotide sequence encoding an immune suppression gene; (11) a promoter; and (111) a transcription termination signal, where the system is able to inhibit, evade or aliminate a recipient cell immune response to the therapeutic gene when the gene is transformed into a recipient cell. AXX90481 to AXX90484 represent specifically claimed plasmid retroviral vector nucleotide sequences from the present invention. The expression system and vectors containing it can be used for gene therapy, for treating an WHC I autoimmune disease or for Killing tumour cells. The expression system contains an immunosuppressive gene which prevents host rejection of the vector. The present sequence represents a plasmid retroviral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9
present invention describes a nucleotide expression system for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CTCGGGGCCAAGAACAGATGGTCCCCCAGATGCGGTCCAGCCCTCAGCAGTTTCTAGTGAA

The myoD proximal and distal regulatory regions (See AAQ74447, AAQ74448) may be inserted into vectors such as this and used (1) to induce a muscle phenotype in a non-muscle cell, (2) for positive or negative selection of muscle cells (3) for targetted gene expression, specifically in skeletal muscle, (4) for the expression of genes controlling growth of myoblasts or mutant forms of myoD that modulate muscle differentiation, (5) for changinearing rhabdosarcoma cells to increase sensitivity to chemotherapeutic agents, (6) for the expression of growth factors to stimulate skeletal muscle growth in animals, and (7) to identify nuclear regulatory factors that bind to the regulatory region
                                                                                      Isolated proximal and distal myoD regulatory regions - and vectors contg. them, for tissue selective gene expression in muscle cells and for positive or negative muscle cell selection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GGAAAAATACATAACTGAGAATAGGAAAGTTCAGATCAAGGTCAGGAACAAAGAAAAACAGC

AAX90481 to AAX90484 represent specifically claimed plasmid retroviral vector nucleotide sequences from the present invention. The expression system and vectors conclaining it can be used for gene therapy, for treating an MHC-I autoimmune disease or for killing tumour cells. The expression system expression an immunosuppressive gene which prevents host rejection 9 GGAAAAATACATAACTGAGAATAGAAAAGTTCAGATCAAGGTCAGGAACAAAGAACAGC TCATCAGATGTTTCCAGGGTGCCCCAAGGACCTGAAAATGACCTGTACCTTTGAAC 61 GGAAAATACATAACTGAGAATAGAAAAGTTCAGATCAAGGTCAGGAACAAGAAACAGC TAACCAATCAGTTCGCTTCTGGCTTCGCGCGCTTCCGCTCTCCGCTCTCCGATAAA ccerarreccaaraaaccrerrecrerrecarceaarcerecrecrecre TTTGAAAGACCCCACCCGTAGGTGGCAAGCTAGCTTAAGTAACGCCACTTTGCAAGGCAT TGAATACCAAACAGGATATCTGTGGTAAGCGGTTCCTGCCCCGGCTCAGGGCCAAGAACA GATGAGACAGCTGAGTGATGGGCCAAACAGGATATCTGTGGTAAGCAGTTCCTGCCCCGG GATGAGACAGCTGAGTGATGGGCCAAACAGGATATCTGTGGTAAGCAGTTCCTGCCCCGG rcarcagargrirccagggrgccccaaggaccrgaaaargacccrgraccrrarraaac AGAGCCCACAACCCCTCACTCGGCGCGCCAGTCTTCCGATAGACTGCGTCGCCCGGGTAC CTCGGGGCCAAGAACAGATGGTCCCCAGATGCGGTCCAGCCCTCAGCAGTTTCTAGTGAA TTTGAAAGACCCCACCGTAGGTGGCAAGCTAGCTTAAGTAACGCCACTTTGCAAGGCAT TAACCAATCAGTTCGCTTCTCGCTTCTGTTCGCGCGCTTCCGCTCTCCGAGCTCAATAAA CCGTATTCCCAATAAAGCCTCTTGCTGTTTGCATCCGAATCGTGGTCTCGCTGTTCCTTG Query Match 31.8%; Score 1644.6; DB 2; Length 7165; Best Local Similarity 62.9%; Pred. The invention provides a novel method for directing self-assembly of a gene having three or more fragments in a directionally and spatially ordered fashion to produce a gene or a gene vector. The method involves usage of primers, containing class IIS restriction endomuclease recognition sites, for isolation of these fragments. As described in the disclosure, the method may also use a vector for the incorporation and soreming of endogenous mouse promoter elements for the incorporation and classific promoters. In the example given, plasmids pBK-CW (AAV33626), pVLMB (AAV33623) and pVLOVHGH-900 (AAV33621) were used as templates from which six fragments were amplified. Bach of the fragments contained different regulatory sequences. The six PCR fragments were designed to self-assemble into a retro-vector using the method of the invention. The present sequence, designated as GENSA 981, represents the monomeric DNA sequence of the six ligated fragments. In general, the method is claimed to be useful for isolating and identifying regulatory sequences from a cell, including those for enhanced biological activity, or tissue-specific, hormone-specific or developmental-specific gene

The invention relates to novel regulatory elements and vectors for the expression of one or more proteins in a host cell. The invention further expression of one or more proteins in a host cell. The invention further provides methods of indirectly detecting the expression of a protein of interest, comprising providing the host cell transfected with a vector desired protein operably linked by an internal ribosome entry site closed protein and the desired protein is produced, where the presence of signal protein and the desired protein is produced, where the presence of signal protein indicates the presence of desired protein. Regulatory elements and vectors of the invention are useful for the expression of proteins of interest in a host cell. They are useful for the expression of chemone, insulin (19), preferably secretory 19; They are useful in the expression of one or more proteins such as erythropoietin, growth commons, von Willebrands factor, into side and their receptors, von Willebrands factor, ind surfactant, serum a blumins, DNase, vascular endothelial growth factors, creeptors for hormones or growth factors, interleaves, or proteins, osteoinductive factors, immunotoxins, proteins, or proteins, osteoinductive factors, interleaves, interleaves, colony stimulating factors, interleavins, and ressins, requirance proteins, and ressins, reduces membrane proteins, and ressins, reduces membrane proteins, or can proteins and their fragments. The vectors and other artibodies, chimeric proteins and their fragments. The vectors and other calls, bovine kidney cells and human kidney cells, including rat finound proteins in elements moloney murine leuvemia virus (Mowlly) 5' LTR, Mowlly viral clements; moloney murine leuvemia virus (Mowlly) 5' LTR, Mowlly INR, phosphotransferase gene and 3' Mowlly INR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel regulatory elements including nucleic acid encoding hybrid alpha-
lactalbumin promoter or mutant RNA export element, for expressing one or
more proteins e.g. antibodies, pharmaceutical proteins in host cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9

The invention relates to a host cell comprising a genome comprising at least one integrated integrating vector, where the integrated integrating vector where the integrating vector lacks a gene encoding a selectable marker. The invention also relates to a method of transfecting host cells, involving providing a number of host cells comprising a genome and a number of integrating vectors, where the integrating vectors comprise at least one exogenous gene, where the integrating vectors comprise at least one exogenous gene, and where the integrating vectors lack a gene encoding a selectable marker, contacting the host cells comprising at least one integrated copy of the integrating vectors to generate transfected host cells comprising at least one integrated copy of the integrating vector and selecting the transfected host cells. The host cell is useful for producing a protein of interest which involves providing a host cell, where the exogenous gene is stable in the absence of selection. The integrating vector further comprises a secretion signal sequence operably linked to the exogenous gene is table in the absence of selection. The integrating vector further comprises a secretion signal sequence operably linked to protoins for pharmaceuticals and industrial, diagnostic and other purposes, and in the production of multiple variants of proteins.

Considered by analysis of the activity of the protein variants. This sequence represents LSRNL vector DNA, used in the scope of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Host cell useful for producing proteins for pharmaceuticals, industrial purposes, comprising genome having at least one integrated vector having at least one exogenous gene and lacking selectable marker.

The invention relates to the production of proteins in host cells. The host cells contain multiple integrated copies of an integrating vector comprising an exogenous gene operably linked to a promoter, and where the integrating vector lacks a gene encoding a selectable marker. The invention is used to produce proteins of interest at high levels. The

The present invention describes a nucleotide expression system for the introduction of a therapeutic gene comprising: (i) a nucleotide sequence encoding an immune suppression gene; (ii) a promoter; and (iii) a transcription termination signal, where the system is able to inhibit, evade or eliminate a recipient cell immune response to the therapeutic gene when the gene is transformed into a recipient cell. AXSO481 to AAX90484 represent specifically claimed plasmid retroviral vector nucleotide sequences from the present invention. The expression system and vectors containing it can be used for gene therapy, for treating an MHC-I autoimmune disease or for killing tumour cells. The expression system contains an immunosuppressive gene which prevents host rejection of the vector Expression system containing therapeutic gene and an immunosuppressor gene useful for treating an MHC-I autoimmune disease or killing tumor cells. 25; Page 144-147; 154pp; English Claim

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                4051
                                                                                                                                                                                                                                                                                                               The present invention describes a nucleotide expression system for the introduction of a therapeutic gene comprising: (1) a nucleotide sequence encoding an immune suppression gene; (ii) a promoter; and (iii) a transcription termination signal, where the system is able to inhibit, evade or eliminate a recipient cell immune response to the therapeutic gene when the gene is transformed into a recipient cell. AAX90481 to AAX90484 represent specifically claimed plasmid retroviral vector nucleotide sequences from the present invention. The expression system and vectors containing it can be used for gene therapy, for treating an MHC.I autoimmune disease or for killing tumour cells. The expression system contains an immunosuppressive gene which prevents host rejection of the vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GATCTGATCAAGAGACAGGATGAGAGCATCGTTTCGCATGAATTGAACAAGATGGATTGCACG
